Treatments

Present status — and its hidden cost

PRESENT STATUS

- Treatments worldwide are dominated by Allopathic / Modern medicine.
- Ayurveda, Unani, Homeopathy, Naturopathy etc. play a very small role in the overall consumption of medicines.
- Scientists and doctors worldwide are finding cures using medicines made from compounds that cure diseases.
- They have succeeded in curing not only diseases but also infections and epidemics once considered incurable, which killed millions.
- These medicines are very effective, as the required compounds are delivered to the desired body part in concentrated form.
- But before reaching the affected part, these compounds travel through much of the body, reacting with unwanted parts and causing damage — **side effects**.
- These side effects must then be treated too — and the process goes on.

THE COST TO OUR ENVIRONMENT

1. Raw materials are extracted through mining or from plants.
2. Solvents are consumed to extract the desired compound.
3. Process effluents are disposed of with active, unused ingredients.
4. These by-products are hazardous to health and environment.
5. Manufacturing needs large amounts of power and water.
6. Packaging uses plastic and other materials.
7. Distribution, transport and storage use fuel, power and space.
8. Waste harms animals, birds and forests, adding to global warming.

SO WE ARE STUCK. WE HAVE WONDERFUL TREATMENTS,
BUT MUST TOLERATE THE SIDE EFFECTS AND ENVIRONMENTAL DAMAGE.

There seems to be no solution at present — let us look for one.

NOTHING IS IMPOSSIBLE

Foundation

The state of the art and the core hypothesis

Continuing the work initiated by the late **Dr. Ramesh Vaish** of NHRC — current research by **Atul Kumar Jain**, graduate, IIT Kanpur (1972)

THE STATE OF THE ART

Among the alternatives to conventional drugs and vaccines, **Energy Medicine** — also called Vibrational Medicine, Frequency Healing or Sound Healing — is actively explored. All share one principle: health can be influenced through energy, frequency and vibration.

Sound healing has deep roots in Indian tradition as *"Brahma-Naad"*, practised for centuries through music, Vedic mantras and chanting. It relaxes the brain, lowers stress and supports immune, physical and mental health, using tone and rhythm to help cells return to a resonant, healthy state. Though legally non-invasive, this research regards it as, in practice, more invasive than most modern medicine — as it is proposed to act directly on the body's smallest cell receptors.

THE CORE HYPOTHESIS

$10^{12} - 10^{14}$ Hz where most compounds resonate

20 – 20,000 Hz the range of human hearing

Every compound is a combination of energy, frequency and vibration. If its frequency is mathematically reduced into the audible range, the body may receive and respond to it through hearing alone.

Dr. Vaish and his team at NHRC proposed converting a compound into a wave (via Raman spectroscopy, IR, NEST etc.), lowering it to audible range and having a person listen. The hypothalamus would "reflect" the pattern into the body, delivering the compound in extremely diluted form. As the raw tone is unpleasant, it is embedded in pleasant music. Early formulations for diabetes and cancer, using Ayurvedic herbs in soft instrumental music, reportedly showed promising results with patient groups in India, Singapore and Canada.

EXPANSION OF THE RESEARCH

NHRC invited **Atul Kumar Jain** — IIT Kanpur engineer with 50+ years' experience, including 25 years researching medicinal plants under the late **Vaid Raj Shri Sushil ji Sah** of Arogya Bharti, Jaipur — to independently lead the next phase, without any binding with NHRC. He took up the challenge.

The Ayurveda medicines researched by Mr. Jain were made under the supervision of certified traditional Vaid **Shri Kamdev Prasad Painuli** of Uttarakhand, who has successfully treated more than 50,000 patients at his clinic at Jari Buti Farm, Village Kohlu Pani, Dehradun, using medicines made under him.

Building the Waves

How a disease-specific wave is researched, composed and proposed to act

THE RESEARCH ACTION PLAN

1. List the diseases in India — **90+ diseases and 20+ cancer types** identified for study.
2. Review existing treatments for each across Ayurveda, Unani, Traditional Chinese Medicine, Modern Medicine, Homeopathy and tribal practices.
3. Identify the medicines and herbs used, their constituent compounds and each compound's proposed curative mechanism.
4. Draw up the compounds and compound combinations to compose waves for each disease.
5. Map the frequency of every molecular bond (often 30–50 per compound) and combine them into the compound's final wave.
6. Choose a matching instrumental **raga** by time of day and the bodily "humor" imbalance of the disease.
7. Select the frequency band by the disease's location in the body — eight bands mirroring sunlight's VIBGYOR and the Chakras, plus 432 Hz.
8. Convert each compound into eight frequencies, one per body location.
9. Make separate waves for **morning, afternoon and evening**, so the wave and music suit the time of day.

WAVE MECHANISM IN THE BODY

WAVE → PHONONS → NEURONS → TARGET REGION

Once a wave enters the body, it is proposed to be carried by phonons to the region matching its frequency. Phonon activity is hypothesised to activate neurons, which may generate similar vibrations that reinforce the compound's effect in the targeted area.

If the compound is already present in the diseased part, it is thought to be boosted by the frequency; if absent, the part receives an extremely diluted concentration through the wave. Either way, some form of curative activation is proposed.

Sound Healing

Separately, the music encasing the waves works as **sound healing** — relaxing the brain, lowering stress and signalling organs to support overall health, in addition to the medicinal wave therapy.

Evidence, Practice & Dedication

An honest account of the evidence, and how the waves are shared

QUANTITATIVE ASSESSMENT & ITS LIMITS

≈ 1×10⁻²⁹ g
mass delivered in a 30-minute wave

The team converted the energy transmitted by a 30-minute wave into an equivalent mass, using a comparatively heavy compound as the test case. **Stated plainly:** this is far below any biologically active dose in conventional pharmacology — functionally non-existent by modern medical standards, where any benefit would be attributed to placebo.

This document does not claim clinical proof of efficacy; it records a hypothesis and an early-stage, non-conventional line of investigation.

As guided by Vaid Raj Sushil ji to Atul K. Jain, once the waves enter the body the *Pudgal* (in present science, neurons) carry the message to the universe, which directs the required compound waves to the body — raising the compound to the desired level and treating the disease. Visiting Sadhus from the Himalayas have also accepted this approach. There is, however, no scientific proof of this theory, nor any way to disprove it.

CURRENT PRACTICE

Waves are given only after the process and method of use have been explained, and only to patients who have fully understood and chosen to try them.

Free
of charge to every patient

100%
informed consent before any wave is used

CC0
the research itself, dedicated to humanity

Where it helps, may it be used freely.
Where it falls short, may others carry it further.

DEDICATED TO HUMANITY
